ATLAS PORTAL REQUIREMENTS

Baseline and delivery scope

Atlas is a fictional customer portal for submitting service requests, reviewing status and exporting authorized operational records.

01 / Baseline status

Version 1.0 is the initial baseline approved on 25 April 2026, effective 01 May 2026. It records the original committed scope. Proposed changes outside this baseline require an impact review and a recorded approval before implementation. Preserve each approved baseline so future decisions can be compared with the original requirements.

02 / Users and boundaries

Requesters submit service requests and see their own records. Customer administrators manage users within their customer organization. Service agents update assigned requests. No user may access another customer's records by changing a URL, export filter or request identifier. Payroll, public signup and payment processing are outside this project scope.

03 / Delivery responsibilities

The product owner maintains requirement IDs and acceptance criteria. Engineering implements the approved baseline. Quality Assurance records evidence against each requirement. The customer approver signs acceptance. Customer onboarding follows AV-CS-001; workforce and security controls remain defined by their separate standards.

Control	Value	Decision owner
Document version	1.0	Product owner
Effective date	01 May 2026	Customer approver
Status	Initial approved baseline	Product owner

ATLAS PORTAL REQUIREMENTS

Requirements and acceptance

Each numbered requirement has an observable acceptance criterion. Security checks must cover negative cases as well as the intended user journey.

REQ-101 / Customer isolation

All list, detail, export and search routes enforce customer-organization permissions on the server. Acceptance: an authorized user from customer A cannot read or export customer B's records, including by using a valid record ID from B. The test checks both the response and the absence of leaked record content.

REQ-102 / Export format

Customer administrators can export authorized records as CSV only. XLSX export is outside this baseline. Acceptance: the CSV includes a header row and only the selected customer's permitted records. Formula-like user input is escaped for spreadsheet safety.

REQ-103 / Operational retention

Operational request data retention is 90 days after a request is closed, unless an approved preservation hold applies. Acceptance: the retention job marks eligible closed records and records its decision. Open requests are excluded. This requirement concerns Atlas operational requests, not workforce records or security audit logs.

REQ-104 / Priority-one support

The priority-one support response time is 4 hours after a verified priority-one ticket is accepted. This means acknowledgement and ownership, not complete recovery. Acceptance: the service desk records the accepted time and first response time, and flags a breach of the applicable target.

Scope and retention are approved fictional project requirements, not claims about a real deployed service.

ATLAS PORTAL REQUIREMENTS

Change record and release gate

A scope change is complete only when the baseline, implementation plan and acceptance evidence all reflect the same approved decision.

04 / Change approval rule

Requests for additional export formats, longer retention or a tighter support response target require a written impact assessment. The product owner and customer approver must record their decision, affected requirement IDs and effective date. Until an updated baseline is approved, the committed requirements on page 2 remain applicable.

05 / Schedule and test impact

The planned go-live date in this baseline is 30 June 2026. Test the CSV export, 90-day closed-request retention and 4-hour priority-one response target, alongside customer isolation. If a later approved change affects these criteria, revise the test plan rather than reusing obsolete expected results.

06 / Release evidence

Before launch, link each requirement ID to its latest test result, list unresolved defects and obtain customer acceptance. Record the approved version and effective date in the handover. A passed demonstration with fictional records is useful evidence of a workflow, but does not establish production capacity, uptime or general data-security guarantees.

Requirement	Approved baseline	Verification owner
REQ-102 export	CSV only	Quality Assurance
REQ-103 retention	90 days after closure	Engineering
REQ-104 response	4 hours	Service owner
Planned go-live	30 June 2026	Product owner
