ATLAS PORTAL REQUIREMENTS

Baseline and delivery scope

Atlas is a fictional customer portal for submitting service requests, reviewing status and exporting authorized operational records.

01 / Baseline status

Version 2.0 is the current approved baseline. It supersedes version 1.0 from 15 June 2026 following change request CR-014, approved on 12 June 2026. The product owner and customer approver accepted the scope and schedule impact. Version 1.0 remains an audit reference and must not be used as the current implementation instruction.

02 / Users and boundaries

Requesters submit service requests and see their own records. Customer administrators manage users within their customer organization. Service agents update assigned requests. No user may access another customer's records by changing a URL, export filter or request identifier. Payroll, public signup and payment processing are outside this project scope.

03 / Delivery responsibilities

The product owner maintains requirement IDs and acceptance criteria. Engineering implements the approved baseline. Quality Assurance records evidence against each requirement. The customer approver signs acceptance. Customer onboarding follows AV-CS-001; workforce and security controls remain defined by their separate standards.

Control	Value	Decision owner
Document version	2.0	Product owner
Effective date	15 June 2026	Customer approver
Status	Current approved baseline	Product owner

ATLAS PORTAL REQUIREMENTS

Requirements and acceptance

Each numbered requirement has an observable acceptance criterion. Security checks must cover negative cases as well as the intended user journey.

REQ-101 / Customer isolation

All list, detail, export and search routes enforce customer-organization permissions on the server. Acceptance: an authorized user from customer A cannot read or export customer B's records, including by using a valid record ID from B. The test checks both the response and the absence of leaked record content.

REQ-102 / Export format

Customer administrators can export authorized records as CSV and XLSX. Requesters cannot export an organization-wide dataset. Acceptance: both formats contain only the selected customer's permitted records, with a header row and the same documented field names. Formula-like user input is escaped for spreadsheet safety.

REQ-103 / Operational retention

Operational request data retention is 180 days after a request is closed, unless an approved preservation hold applies. Acceptance: the retention job marks eligible closed records and records its decision. Open requests are excluded. This requirement concerns Atlas operational requests, not workforce records or security audit logs.

REQ-104 / Priority-one support

The priority-one support response time is 1 hour after a verified priority-one ticket is accepted. This means acknowledgement and ownership, not complete recovery. Acceptance: the service desk records the accepted time and first response time, and flags a breach of the applicable target.

Scope and retention are approved fictional project requirements, not claims about a real deployed service.

ATLAS PORTAL REQUIREMENTS

Change record and release gate

A scope change is complete only when the baseline, implementation plan and acceptance evidence all reflect the same approved decision.

04 / CR-014 decision

CR-014 adds XLSX export alongside CSV, extends closed-request retention from 90 days to 180 days, and tightens the priority-one response target from 4 hours to 1 hour. Approval was recorded on 12 June 2026; the effective date is 15 June 2026. Customer isolation REQ-101 is unchanged. Security reviewed the longer retention and export controls before approval.

05 / Schedule and test impact

The planned go-live changes from 30 June 2026 to 07 July 2026 to cover spreadsheet export testing and retention-job verification. Quality Assurance must repeat customer-isolation tests for both export formats. The service owner must confirm priority-one coverage before accepting the new response target. No pricing or uptime commitment is added by this change.

06 / Release evidence

Before launch, link each requirement ID to its latest test result, list unresolved defects and obtain customer acceptance. Record the approved version and effective date in the handover. A passed demonstration with fictional records is useful evidence of a workflow, but does not establish production capacity, uptime or general data-security guarantees.

Requirement	Version 1.0	Version 2.0
REQ-102 export	CSV only	CSV and XLSX
REQ-103 retention	90 days after closure	180 days after closure
REQ-104 response	4 hours	1 hour
Planned go-live	30 June 2026	07 July 2026
